---

While this summer's record-breaking drought has been tough on cool season grasses and farmers, other options exist when it comes to livestock forage. The North Carolina Wildlife Resources Commission is promoting its Cooperative Upland habitat Restoration and enhancement program, or CURE. CURE promotes the creation of small game habitat using native plants, such as drought-resistant warm season grasses. Warm season grass varieties thrive during the hottest months of the year and do not require substantial summer rainfall. For more information, visit [www.ncwildlife.org](http://www.ncwildlife.org).
